

## Carroll (Coös)

Carroll is a rural town in northern New Hampshire, home to the Mount Washington Hotel near the White Mountains. There are 211 residents age 65 or older. Compared to state average rates, older residents fared better on some healthy aging indicators with lower rates of obesity, depression, anxiety disorders, Alzheimer’s disease or related dementias, stroke, chronic obstructive pulmonary disease, congestive heart failure, osteoporosis, lung cancer, hypothyroidism, anemia, chronic kidney disease, fibromyalgia/chronic pain/fatigue, glaucoma, and cataracts. However, they had higher rates of schizophrenia and other psychotic disorders. Community resources to support healthy aging include 2 primary care providers within 5 miles, 2 home health agencies, and a public library.

<b>POPULATION CHARACTERISTICS</b>	<b>BETTER / WORSE STATE RATE<sup>1</sup></b>	<b>COMMUNITY ESTIMATE</b>	<b>STATE ESTIMATE</b>
Total population all ages		897	1,327,503
Population 60 years or older as % of total population		32.2%	22.7%
Total population 60 years or older		289	301,630
Population 65 years or older as % of total population		23.5%	15.8%
Total population 65 years or older		211	210,385
% 65-74 years		79.6%	58.5%
% 75-84 years		19.4%	28.6%
% 85 years or older		0.9%	12.9%
Gender (65+ population)			
% female		47.4%	54.7%
Race/Ethnicity (65+ population)			
% White		100.0%	97.7%
% African American		0.0%	0.5%
% Asian		0.0%	0.9%

#### TECHNICAL NOTES

\*See our technical report (online at <https://healthyagingdatareports.org/>) for more information on data sources, measures, methodology, and margin of errors. For most indicators the reported community and state values are both estimates derived from sample data. Thus, it is possible that some of the differences between state and community estimates may be due to chance associated with population sampling. We use the terms “better” and “worse” to highlight differences between community and state estimates that we are confident are not due to chance. “Better” is used where a higher/lower value has positive implications for the health of older residents. “Worse” is used where a higher/lower score has negative implications for the health of older people, and when the implication is unclear, we use an \*. We balance two goals. First, we aim to report data at very local levels because we believe change is often locally driven. Second, we vowed to protect the privacy of the people providing the information reported. Thus, given the constraints of the data analyzed we used a hierarchical approach to reporting. When possible we report estimates for 244 geographic units (i.e., every NH city/town and 5 Manchester neighborhoods, 4 Nashua neighborhoods). For example, the population characteristics were reported for all 244 units. For other data (i.e., highly prevalent chronic disease, health services utilization) we could report for 154 geographic units. For less prevalent conditions we report for 69 geographic units. For the BRFSS data we report for 28 geographic units, and for the lowest prevalence conditions (e.g., HIV) we report for 4 geographic units. The same estimate is reported for all cities/towns within aggregated geographic areas. Maps of the different geographic groupings and the rationale behind the groupings are in the Technical Report.
